

# Andrei Neagoe

FULL-STACK SOFTWARE ENGINEER | CLOUD & AI

+447543519824 / neagoeandrei23@gmail.com / [LinkedIn](#) / [GitHub](#) / [Portfolio](#)

---

Full-stack engineer working across cloud infrastructure, Python back-ends and React front-ends. At Framestore I design and ship serverless AWS services and the Terraform that provisions them, and maintain the event-driven messaging platform connecting the company's internal applications. Alongside that I am the sole engineer behind Garzoni, an AI-powered financial learning platform live on web, iOS and Android with 150+ users. I am equally comfortable owning infrastructure, API design and the interface on top of them, and I care about measured results such as latency, cost and reliability.

## PROFESSIONAL EXPERIENCE

---

### Associate Software Developer — Framestore

Jul 2025 – Present

- Built and shipped the Public Links service end to end: a React front-end on a serverless AWS back-end (API Gateway, a Step Functions Express chain across five Python Lambdas, RDS Postgres and batch S3 pre-signed URLs) with an ElastiCache layer that cut repeat loads from 348 ms to 21 ms.
- Automated the infrastructure in Terraform with per-environment remote state, introduced isolated per-developer AWS environments now standard on the team, and hardened the public endpoint with AWS WAF and a CloudFront origin lock.
- Took cold invocations from 100% to 2–3% and average response from 3.3 s to 290 ms through Lambda memory profiling, an 18 MB → 1 MB deployment package and a scheduled warmer.
- Owned features across the stack: built impersonation sessions in Filestore (permission model, nested session, UI indicator and audit trail) and shipped product features and back-end refactors in Fetch, the production task-import tool.
- Built multi-participant remote cursors and annotations over shared video in Framecast using WebRTC, Janus DataChannels and custom canvas layers, and optimised Flock's React scheduling Gantt with date-windowed fetching.
- Maintained Framestore's Events Bus (RabbitMQ, MongoDB, Ansible): moved message callbacks onto a thread pool to eliminate heartbeat starvation, added per-service broker authentication, and led the client rollout across 12 downstream applications.
- Delivered across ~10 internal products in a year, including legacy modernisation (Python 2→3, RPM to Docker and Ansible, CentOS 7 to EL9) and a read-only Jira API proxy.
- Authored the reference documentation the team deploys against, demoed every two-week sprint, presented monthly to the technology department, and onboarded the team's summer intern.

### Data Automation Developer — Brixton Radio

Sep 2024 – Mar 2025

- Reduced manual data processing by 40% by designing an automated API-driven data extraction system, effectively managing high-volume social media and analytics data.
- Integrated Google Calendar and Forms to streamline management of 50+ weekly radio shows, improving metadata accuracy by 30% in a dynamic broadcast environment.

## PROJECTS

---

### Garzoni — AI-Powered Financial Learning Platform | Founder & Sole Engineer

2024 – Present

- Built and shipped the entire product solo: a pnpm monorepo spanning a Django 5.2 / DRF / Celery API, a React 19 web app and an Expo mobile app sharing a TypeScript core. 900+ commits over 21 months, live on the App Store, Google Play and web with 150+ users.
- Built an AI tutor on OpenAI function calling with RAG over the curriculum (pgvector), voice tutoring via Whisper and TTS, receipt analysis via GPT-4o vision, and a learning path re-ranked daily by an LLM, hash-short-circuited to avoid redundant model spend.

- Shipped the commercial layer: three-tier subscriptions with cross-platform entitlements via RevenueCat (Stripe Web Billing, App Store and Play IAP), Plaid open-banking budgeting with statement import, and per-tier quotas and paywalls.
- Engineered the platform behind it: gamification (streaks, daily and weekly missions, leagues, leaderboards, spaced-repetition review); JWT auth with Google and Apple sign-in; brute-force protection, reCAPTCHA Enterprise and Sentry; Celery scheduled jobs; 20+ backend test suites.
- Ran it in production end to end: Docker, Railway, Vercel and EAS store releases, Cloudflare edge caching, health-gated deploys, automated backups and CI enforcing pinned dependencies, vulnerability auditing and secret scanning.

TECHNICAL SKILLS

---

|               |                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Languages     | Python, JavaScript, TypeScript, SQL                                                                                                                    |
| Cloud & Infra | AWS (Lambda, Step Functions, API Gateway, CloudFront, WAF, S3, RDS, ElastiCache, VPC, IAM, Amplify), Terraform, Docker, GitLab CI, GitHub Actions, GCP |
| Backend       | Django, DRF, FastAPI, REST APIs, Celery, PostgreSQL, MySQL, MongoDB, RabbitMQ, Redis                                                                   |
| Frontend      | React, React Native / Expo, Vite, HTML5, CSS3, Tailwind                                                                                                |
| Other         | Git, WebRTC, LLM APIs (OpenAI, Claude), Figma, Agile/Scrum                                                                                             |
| Spoken        | English (Proficient), Romanian (Native)                                                                                                                |

EDUCATION

---

**BSc (Hons) Computer Science** | Queen Mary University of London

2022 – 2025

- BCS-accredited degree from the School of Electronic Engineering and Computer Science.
- Focused on software engineering, databases, web development and neural networks, with team projects run to a full delivery cycle from requirements through to demo.

ADDITIONAL INFORMATION

---

- **Internal Training, Framestore (ML at Framestore):** four-day programme covering ML theory and hands-on model building, MLOps development and deployment, data provenance and asset tracking in production, diffusion models and large language models.
- **Internal Training, Framestore (Web Development Group):** ongoing 30+ session programme on the company's standardised web stack: React, Vue, Django, FastAPI, REST API design and lifecycle, Docker, GitLab CI deployment, load balancers, Google SSO/OAuth, ELK logging and GCP cloud workshops.
- **Masterclasses at the Royal Academy of Engineering (Nov 2023 – Jun 2024):** selected for the Graduate Engineering Engagement Programme, an eight-month series on professional networking, public speaking and personal branding, alongside sessions on engineering career pathways, sustainability, and taking research through to commercialisation.
- **Awards:** Accolades in multiple national high school Olympiads for Mathematics and Computer Science.
