

Andrei Neagoe

FULL-STACK SOFTWARE ENGINEER | CLOUD & AI

+447543519824 / neagoeandrei23@gmail.com / LinkedIn / GitHub / Portfolio

Full-stack engineer working across cloud infrastructure, Python back-ends and React front-ends. At Framestore I design and ship serverless AWS services and the Terraform that provisions them, and maintain the event-driven messaging platform connecting the company's internal applications. Alongside that I am the sole engineer behind Garzoni, an AI-powered financial learning platform live on web, iOS and Android. I am equally comfortable owning infrastructure, API design and the interface on top of them, and I care about measured results such as latency, cost and reliability.

PROFESSIONAL EXPERIENCE

Software Developer — Framestore

Jul 2025 - Present

- Built a serverless AWS back-end for the Public Links service: API Gateway, Step Functions and five Python Lambdas over RDS Postgres, with S3 pre-signed URLs and an ElastiCache layer that cut repeat link loads from 0.8 s to 0.16 s.
- Provisioned the full stack in Terraform (Lambda, API Gateway, CloudFront, WAF, ElastiCache, VPC, IAM) with per-environment remote state and GitLab CI deployment, including isolated per-developer AWS environments now used across the team.
- Hardened the public API with AWS WAF and a CloudFront origin lock, and cut cold-start latency from ~19 s to ~5 s through Lambda memory profiling, an 18 MB → 1 MB deployment package and a scheduled warmer.
- Maintained Framestore's Events Bus (RabbitMQ, MongoDB, Ansible): moved message callbacks onto a thread pool to eliminate heartbeat starvation and connection-drop storms, added per-service broker authentication, and led the client rollout across 12 downstream applications.
- Enhanced Flock's React scheduling UI and built collaborative annotation in Framecast using WebRTC, Janus DataChannels and custom canvas layers, alongside support work and sprint planning in an Agile team.

Project Manager on Data Automation — Brixton Radio

Sep 2024 - Mar 2025

- Reduced manual data processing by 40% by designing an automated API-driven data extraction system, effectively managing high-volume social media and analytics data.
- Integrated Google Calendar and Forms to streamline management of 50+ weekly radio shows, improving metadata accuracy by 30% in a dynamic broadcast environment.

TECHNICAL SKILLS

Languages	Python, JavaScript, TypeScript, SQL
Cloud & Infra	AWS (Lambda, Step Functions, API Gateway, CloudFront, WAF, S3, RDS, ElastiCache, VPC, IAM, Amplify), Terraform, Docker, GitLab CI, GitHub Actions, GCP
Backend	Django, DRF, FastAPI, REST APIs, Celery, PostgreSQL, MySQL, MongoDB, RabbitMQ, Redis
Frontend	React, React Native / Expo, Vite, HTML5, CSS3, Tailwind
Other	Git, WebRTC, OpenAI APIs, Claude API & Claude Skills, Figma, Agile/Scrum
Spoken	English (Proficient), Romanian (Native)

PROJECTS

Garzoni — AI-Powered Financial Learning Platform | Founder & Sole Engineer 2024 – Present

- Built and shipped the entire product solo: a pnpm monorepo of ~250,000 lines across a Django 5.2 / DRF / Celery API, a React 19 web app and an Expo mobile app sharing a TypeScript core. 900+ commits over 21 months, live on the App Store, Google Play and web with 150+ users.
- Built an AI tutor on OpenAI function calling with RAG over the curriculum (pgvector), voice tutoring via Whisper and TTS, receipt analysis via GPT-4o vision, and a learning path re-ranked daily by an LLM, hash-short-circuited to avoid redundant model spend.
- Shipped the commercial layer: three-tier subscriptions with cross-platform entitlements via RevenueCat (Stripe Web Billing, App Store and Play IAP), Plaid open-banking budgeting with statement import, and per-tier quotas and paywalls.
- Engineered the platform behind it: gamification (streaks, daily and weekly missions, leagues, leaderboards, spaced-repetition review); JWT auth with Google and Apple sign-in; brute-force protection, reCAPTCHA Enterprise and Sentry; Celery scheduled jobs; 20+ backend test suites.
- Ran it in production end to end: Docker, Railway, Vercel and EAS store releases, Cloudflare edge caching, health-gated deploys and automated backups, with CI enforcing pinned dependencies, vulnerability auditing and secret scanning, plus EN/RO localization and shared design tokens across web and mobile.

EDUCATION

BSc (Hons) Computer Science | Queen Mary University of London 2022 – 2025

- BCS-accredited programme in the School of Electronic Engineering and Computer Science, covering Procedural and Object-Oriented Programming, Algorithms & Data Structures, Computer Systems & Networks, Database Systems, Software Engineering, Web Programming and Neural Networks & Deep Learning.
- Completed the individual final-year project alongside team-based software engineering coursework, taking a leadership role in group projects and ranking in the top 10% for key technical modules.

ADDITIONAL INFORMATION

- **Internal Training, Framestore (ML at Framestore):** four-day programme covering ML theory and hands-on model building, MLOps development and deployment, data provenance and asset tracking in production, diffusion models and large language models.
- **Internal Training, Framestore (Web Development Group):** ongoing 30+ session programme on the company's standardised web stack: React, Vue, Django, FastAPI, REST API design and lifecycle, Docker, GitLab CI deployment, load balancers, Google SSO/OAuth, ELK logging and GCP cloud workshops.
- **Workshops:** Masterclass at the Royal Academy of Engineering on professional networking, public speaking and personal branding.
- **Awards:** Accolades in multiple national high school Olympiads for Mathematics and Computer Science.
